

METHOD AND APPRATUS FOR NETWORK DIALING FOR VOICE
SWITCHING

ABSTRACT

5 A network dialing scheme for voice switching is
provided. The network dialing scheme provides method and
apparatus for reducing the configuration requirements and
complexity of configuring H.323 gateways on an H.323
network. The network dialing scheme also provides an user-
10 friendly interface. The configuration of the H.323 gateway
may be done using ASCII text files that can be distributed
to multiple machines with little or no modifications. In
the network dialing scheme, numbering plans are defined in
which destinations are related with phone groups.
